

ISO 2409:1992, Paints and varnishes - Cross-cut test

Specifies a test method for assessing the resistance of paint coatings to separation from substrates when a right-angle lattice pattern is cut into the coating, penetrating through to the substrate. The method may be carried out as a pass/fail test or as a six-step classification test. Hard and soft substrates need a different test procedure. The property measured depends, among other factors, on the adhesion of the coating to either the preceding coat or the substrate. This title may contain less than 24 pages of technical content.
